

I appeared for an interview at EXL — the discussion revolved heavily around HTML5, JavaScript, and real-world coding logic.

Here's a breakdown of the questions they asked 🙋

◆ HTML5

- What are the new features introduced in HTML5?
- Difference between `<b>` and `<strong>` tags?
- What is the purpose of the `<canvas>` element?
- How does `localStorage` differ from `sessionStorage`?
- Explain semantic tags and why they are important.

◆ JavaScript (Core + ES6)

- Explain `var`, `let`, and `const` with examples.
- How does event bubbling and capturing work in JavaScript?
- What is the difference between shallow copy and deep copy?
- How does JavaScript handle asynchronous operations?
- Explain the concept of closures.
- Implement `debounce` and `throttle` functions manually.

(They specifically asked me to write code for a throttle function — to limit the rate of function execution during continuous events like scroll or resize.)

🧠 Coding Round

- Write a function to implement `throttle(fn, delay)` so that the given function `fn` executes only once in a specified delay time even if called multiple times.
